Our Work
in Data

A world map illustrating the global distribution of national climate change policies. The map is color-coded based on the number of countries in each region that have implemented such policies. A legend at the bottom indicates the scale: 0 (yellow), 10, 25, 50, 100, and 200 (dark red). The highest density of countries with policies is concentrated in sub-Saharan Africa, where several countries are colored dark red, indicating more than 200 countries in that region have policies. Other regions with moderate to high counts include parts of South America, Southeast Asia, and Central Asia. Most of North America, Europe, and Australia are colored yellow, indicating 0 to 10 countries in those regions have policies.
